

Usual way to connect nodes with path

Arrow under ellipse to rectangle with `-|` as path ID

In case someone needs it, this syntax is explained in pgfmanual section "13.3.1 Intersections of Perpendicular Lines".

`(<p> |- <q>)` or `(<q> -| <p>)` represent a coordinate at intersection point between a vertical line passing through coordinate `<p>` and an horizontal passing through `<q>`. You can use named coordinates like `(bestil.north |- eier.south)` that is used here or numeric pairs like in `(2,1 |- 3,4)`.
